The Problems

No Rating System

Students have no way to know what a dish at the canteen is like without trying it first.

Lack of Visibility

Students have no way to know whether a canteen is open, its waiting times, or its menu without visiting it in person.

Time Wastage

Students waste valuable time waiting after placing their orders, time that could be spent more productively.

Manual Entries

Canteen managers must manually write down current orders, which is both inconvenient and prone to errors.

Potential Users

Customers

- Skip long queues and browse menus remotely
- Secure digital wallet for "cashless" transactions
- Mobile-friendly ordering, a rating system for dishes.

Canteen Owners

- Real-time order management dashboard
- Detailed revenue analytics to identify top-selling items.
- Digital Order System and menu controls.

System Requirements

User Management

- Secure registration & login (students, canteen managers, admins)
- Digital wallet with PIN-based authentication
- Canteen Manager Dashboard

Order Management

- Real-time menu browsing with search & filters (veg/non-veg, category)
- Cart system with seamless checkout
- Live order tracking with status updates
- Order cancellation with manager approval

Analytics & Reporting

- Revenue tracking with monthly/yearly breakdowns
- Top-performing dishes ranked by orders & revenue
- Average order value & completed order metrics

Platform Features

Three User Roles

Customer-Manager-Admin

Separate interfaces for each role, with protected routes on the frontend and permission checks on every API endpoint.

Ordering

Browse, Filter, Cart, Checkout

Live menus by category from breakfast to desserts, veg or non-veg filter, search, and a cart with inline wallet top-up at checkout.

Wallet

4-Digit PIN Transactions

Built-in digital wallet with PIN-protected payments, quick top-up amounts, and OTP-based PIN recovery.

Manager Tools

Queue, Menu, Schedule, Analytics

Live order feed, full dish management with photos, holiday calendar, and monthly revenue charts.

Technical Architecture

Frontend

React 18 | Tailwind CSS

Backend

Django 4.2

Database

PostgresSQL 12

Security

Session Auth | OTP Signup | Wallet PIN

Demonstration

http://172.27.16.252:3000

Future Development Plan

Native Mobile Apps

React Native or Flutter for Android and iOS with proper push notifications so that students get notifications when their order is marked ready.

Real UPI Integration

Replace the fake wallet system with UPI gateway payments.

Cross-Hostel Delivery Support

Order from any campus canteen with delivery available across hostels and academic areas.

User Statistics and Personalised Recommendations

Track user statistics like monthly expenditure and get personalized food recommendations based on your preferences, timings, and past orders.

Lessons Learnt

- Team Work
- Building reactive Frontend
- Merging conflicts in Git
- Defining early database schema design
- Large scale project management
- Designing role-specific interfaces
